SAMPLE — made-up business. Shows what a real audit looks like.

Free mini-audit · Birch & Wick Candles (made up) · https://birch-and-wick.example/ · checked 17 October 2026

3 places where orders slip through, and how to catch them automatically

Prepared for Birch & Wick Candles (made up) by Sebastian, Codru Atelier. Everything here comes from your public website and Google listing.

Where orders slip through

NEEDS WORK	**Stock alerts**	4 of the first 12 products listed are sold out, with no back-in-stock signup
NEEDS WORK	**Abandoned-cart reminder**	No email signup on the home page, so a left cart can't get a reminder
NEEDS WORK	**Order updates**	No order-tracking or order-status page
NEEDS WORK	**Speed on a phone**	Mobile PageSpeed score 44 of 100 (loads in about 7.4 s)
OK	**Easy checkout**	Looks good.

The 3 fixes I would start with

1. Know before you sell out, and keep sold-out items out of the way

What I saw: 4 of the first 12 products listed are sold out, with no back-in-stock signup
How it works: A low-stock alert reaches you before an item runs out → Sold-out items move to the end of the collection → Shoppers can ask to be told when it's back
Effort: ready in 5–7 days. Ask me for the 60-second demo video.

2. Bring back shoppers who leave their cart

What I saw: No email signup on the home page, so a left cart can't get a reminder
What it can cost: Nearly 70% of shoppers leave their cart before paying (Baymard Institute); reminder emails average a 45% open rate (SaleCycle). Both reported by AiTrillion. (industry estimate, not your numbers)
How it works: A shopper leaves items in the cart → An hour later, a friendly reminder email → A second one the next day, then it stops
Effort: ready in 5–7 days. Ask me for the 60-second demo video.

3. Tell customers where their order is, automatically

What I saw: No order-tracking or order-status page
How it works: Each order gets updates when it ships and arrives → A delayed order sends an apology and a new date → Fewer "where is my order?" emails for you
Effort: ready in 5–7 days. Ask me for the 60-second demo video.

Your site on a phone

44

Speed score on a phone, out of 100 (Google PageSpeed Insights). Loads in about 7.4 s. 90+ is good, under 50 is slow.
Real visitors (Google Chrome data): the page shows in 3.9 s (good is 2.5 s or less); taps respond in 240 ms (good is 200 ms or less); layout shift 0.08 (good is 0.1 or less).

Other things I checked

Everything else I checked looks fine.

Want me to set up the first one for you? Starter projects from $500, fixed price, ready in 7 to 10 days. Just reply to my email.

How I checked: Google PageSpeed Insights (mobile), your public website pages and your public Google listing, on 17 October 2026. Every number about your business was measured that day. Cost figures are industry estimates, not your numbers: https://www.aitrillion.com/blog/understanding-abandoned-cart-rates-in-shopify-ecommerce-stores.
